SEARCH REQUEST FORM

Scientific and Technical Information Center

Requester's Full Name: Nathan Nutter Examiner #: 61046 Date: 11 Dec 2006
Art Unit: 1711 Phone Number 30 21076 Serial Number: 10/516,698
Mail Box and Bldg/Room Location: Remsen B75 Results Format Preferred (circle): PAPER DISK E-MAIL

If more than one search is submitted, please prioritize searches in order of need.

****

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: (Meth)acrylic esters of polyalkoxylated trimethylol propane

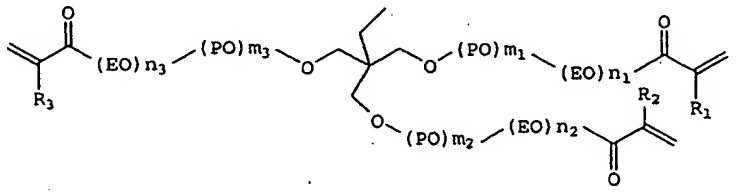
Inventors (please provide full names): Popp et al

Earliest Priority Filing Date: 06/11/2002

**For Sequence Searches Only* Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.*

IN THE CLAIMS:

1. (Previously presented) An ester F of formula I



I

wherein EO is O-CH2-CH2-,

PO is independently at each instance O-CH2-CH(CH3)- or O-CH(CH3)-CH2-,

n1, n2, and n3 are independently 4, 5, or 6,

n1 + n2 + n3 is 14, 15, or 16,

m1, m2, and m3 are independently 1, 2, or 3,

m1 + m2 + m3 is 4, 5, or 6, and

R1, R2, and R3 are independently H or CH3.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
AB A continuous process for the preparation of highly stable, finely divided, low viscosity polymer polyols of small average particle size wherein in the first step an intermediate is prepared by reacting (1) a mixture of at least two ethylenically unsaturated monomers, preferably styrene and acrylonitrile, in a mixture comprising (2) a base polyol and (3) a macromer in the presence of (4) a free radical initiator, (5) a solvent having moderate chain transfer activity, and, optionally, (6) a reaction moderator at a temperature of at least 100° C., such

that the intermediate contains at least about 12% by weight of macromer, based on the weight of the base polyol and macromer, and a solids content of at least about 15% by weight and less than about 30% by weight, based on the weight of the base polyol, macromer and ethylenically unsaturated monomers. The intermediate, which functions as a seed for further polymerization, is then further reacted, in one or more stirred-tank reactors in series, in a mixture of at least two ethylenically unsaturated monomers, preferably styrene and acrylonitrile, in a base polyol and, optionally, a macromer, in the presence of solvent, initiator and a reaction moderator which are distributed among the remaining reactors.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
AB The instant invention relates to a process for the preparation of stable suspensions of inorganic fillers in polyhydroxyl compounds, which are suitable for the preparation of polyurethanes, to the suspensions obtainable by this process and to their use for the preparation of polyurethanes. The suspensions are produced by grafting an olefinically unsaturated carboxylic acid (and optionally other olefinically unsaturated monomers) onto polyols. The presence of from 0.005 to 15% by weight of carboxyl groups in the polyol allows for the production of stable dispersion of inorganic fillers in polyols.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

GI

I

AB Acrylic and/or methacrylic esters of alkoxylated trimethylolpropane have the general formula (I), where EO is -OCH2CH2-, PO independently represents -OCH2CH(CH3)- or -OCH(CH3)CH2-; n1, n2, n3 are independently 4, 5 or 6; the total of n1, n2 and n3 equals to 14, 15 or 16; m1, m2, m3 are independently 1, 2 or 3; the total of m1, m2 and m3 equals to 4, 5 or 6; and R1, R2 and R3 are independently H or CH3. The esters can be used as crosslinking agents in production of hydrogels, or as components in cement additive compns. or in production of polymer dispersions and lacquers. Thus, an alkoxylated trimethylolpropane was produced by reacting trimethylolpropane (77) in water in the presence of KOH (0.5) with propylene oxide (167) at 120-130°, followed by adding and reacting with ethylene oxide (379 g) at 145-155°. The alkoxylated trimethylolpropane (887) was mixed with acrylic acid (216) and esterified in the presence of H2SO4 (5 parts) and polymerization inhibitors. The obtained alkoxylated trimethylolpropane triacrylate was used as a crosslinking agent in radical polymerization with acrylic acid and sodium acrylate.

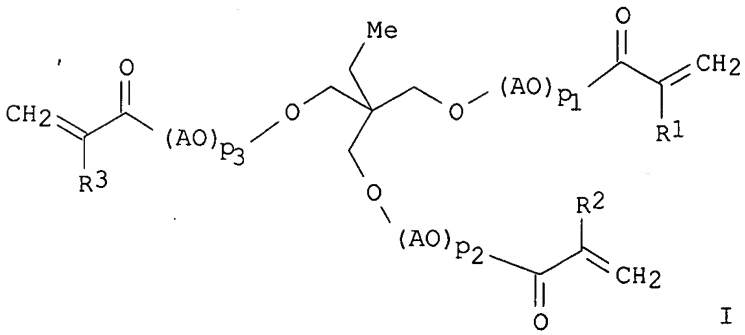
GI



I

AB Acrylic and/or methacrylic esters of alkoxylated trimethylolpropane have the general formula (I), where each AO independently represents EO, PO or BO, EO being -OCH2CH2-, PO being -OCH2CH(CH3)- or -OCH(CH3)CH2-, BO being -OCH2CH(CH2CH3)- or -OCH(CH2CH3)CH2-; the total of p1, p2 and p3 equals to an integer from 28 to 75; and R1, R2 and R3 are independently H or CH3. The esters can be used as crosslinking agents in production of hydrogels, or as components in cement additive compns. or in production of polymer dispersions and lacquers. Thus, an alkoxylated trimethylolpropane was produced by reacting trimethylolpropane (77) in water in the presence of KOH (0.5) with ethylene oxide (759) at 145-155°, followed by adding and reacting with propylene oxide (167 g) at 120-130°. The

alkoxylated trimethylolpropane (1,427) was mixed with acrylic acid (216) and esterified in the presence of H2SO4 (5 parts) and polymerization inhibitors.

The obtained alkoxylated trimethylolpropane triacrylate was used as a crosslinking agent in radical polymerization with acrylic acid and sodium acrylate.

AB The title resin composition contains (a) a CO2H-containing binder polymer, (b) photopolymg. compds. having ≥1 polymerizable ethylenic unsatd. bond in their mols. including compds. MeCH2[CH2CH2O(AO)m1(BO)n1COCR1:CH2][CCH2O(AO)m2(BO)n2COCR2:CH2][CH2CH2O(AO)m3(BO)n3COCR 3:CH2] [R1-3 = H or Me; A, B = C2-6 alkylene (A ≠ B); m1 + m2 + m3 = 6-45; n1 + n2 + n3 = 3-45] and I [R4, R5 = H or Me; X, Y = C2-6 alkylene; Z1, Z2 = halo, H, C1-20 alkyl, C3-10 cycloalkyl, amino- or C1-20 alkyl-substituted aryl, amino, SH, C1-10 alkylmercapto, C1-10 alkyl-containing carboxyalkyl, C1- 20 alkoxy, heterocycle-containing group; p + q = 8-40; s, t = 1-4] as essential components, and (c) a photopolymn. initiator. The photosensitive element comprises a support laminated with the composition and an optional protective film and is laminated on a substrate for forming a circuit while the protective film is being peeled off, if necessary, imagewise exposed to activating ray to photo-cure the exposed areas, and developed to remove the unexposed areas to form a resist pattern. The substrate on which a resist pattern has been formed by the above process is subjected to etching or plating to give a printed circuit board. The composition shows high photosensitivity and provides high resolution resist patterns with high plating resistance, adhesivity, mech. strength, and flexibility.

AB Highly stable, finely divided, low viscosity polymer polyols of small average particle size, useful for preparation of polyurethane foams, are manufacture by 1st reacting (1) a mixture of styrene and acrylonitrile (I) in a mixture of (2) a polyoxyalkylene polyether polyol and (3) a macromer in the presence of (4) a free radical initiator, (5) a solvent having moderate chain transfer activity and optionally (6) a reaction moderator at a temperature of ≥100° to give a seed with macromer content ≥12% with respect to the polyol mixture and the solids content 15-30%, and then using the seed in further stirred-tank reactors for a similar polymerization of styrene with I but optionally in the presence of a macromer. A typical macromer was manufactured by reaction of ethylene oxide-propylene oxide copolymer trimethylolpropane ether with maleic anhydride and subsequently with ethylene oxide.

I

AB Stable, agglomerate-free, low viscosity graft copolymer dispersions are produced by radical polymerization of ethylenically unsatd. monomers in the presence of a base polyol, a macromer, an enol ether chain-transfer agent A=CHOR (A is I; R is a C1-18 aliphatic hydrocarbon radical, a C5-10 cycloaliph. hydrocarbon radical, or a (substituted) benzyl radical; R' is H or a C1-8 aliphatic hydrocarbon radical), and optionally, an organic solvent. Acrylonitrile and styrene were polymerized with ethylene trimethylolpropane-initiated oxide-propylene oxide copolymer acrylate macromer in the presence of cyclohex-3-enylidene-cyclohexyl ether to give a graft copolymer which was used in manufacture of a polyurethane foam.

AB The claimed acrylate is obtained by forming an adduct of alkylene oxides to a polyhydric alc., then esterifying; the polyhydric alc. containing ≥3 OH in 1 mol., the alkylene oxide being propylene oxide or its mixture with ethylene oxide (propylene oxide ≥67 mol%), the addition amount of alkylene oxides to polyhydric alc. being average 5-12 mol/mol(OH), and there existing average ≥1.5 (meth)acrylate ester group in 1 mol.. The (meth)acrylate shows superior plating-resistance, easy peeling off property and low irritation to skin.

AB The title electrolytes are prepared by dissolving a solvent and an electrolyte salt in a trifunctional terminal acryloyl-modified alkylene oxide polymer containing a polymer chain described by the general formula I (R' = a low mol. weight alkyl group; R'' = H or Me; m, or n = 0 or an integer ≥1; and m + n ≥35) and crosslinking it. The electrolytes are ion conductors and applications in cells, electrochromic displays, and sensors are indicated.

AB The batteries use electrolytes obtained by crosslinking a mixture containing a trifunctional group polymer, an electrolyte salt, and a solvent by energy beam irradiation and/or heating; where the polymer contains 3 functional polymer chains of (CH2CH2O)m(CH2CRHO)nCOCR1:CH2 (R = C1-6 alkyl group, R1 = H or Me, m + n ≥35, and m or n may be 0), and the solvent is used at 220-950% the weight of the polymer. The batteries may use the electrolyte as separators and cathodes containing the electrolyte, or use anodes containing the electrolyte.

AB The copolymers useful as petroleum emulsion breakers are prepared from hydrophobic (meth)acrylic acid esters, their alc. components derived from a mixture of polyglycols and polyglycol ethers, with hydrophilic, ethylenic unsatd. monomers, whereby in copolymers (i) all or substantially all free OH-groups are etherified, esterified, or converted into urethane groups and/or (ii) by esterification the acid is neutralized by amine addition Thus, 893 g acrylic acid ester with ethoxylated-propoxylated trimethylolpropane and 95.8 g acrylic acid, in the presence of 453 mg 2,2'-azobisisobutyronitrile and 460 g xylene, were copolymd. at 80°

for 3 h to obtain a polymer (K-value 13.2, measured as 1% xylene solution), which was then treated with 14.3 g acetic anhydride at 100° for 3 h for end group protection and neutralized with 7.7 g tributylamine for catalytic acid to yield a final product having 23.8 K-value and <1 OH-number

AB Polyols grafted with (meth)acrylic acid and, in some cases, other vinyl monomers were used to stabilize suspensions of inorg. fillers in polyols. These suspensions were useful for the manufacture of polyurethanes. Thus, a polyol (I) (mol. weight 4800) prepared from (HOCH2)3CEt, ethylene oxide, and propylene oxide was grafted (200 parts) with 10 parts styrene and 20 parts acrylic acid, and 52 parts graft copolymer was mixed with 400 parts I and 80 parts CaCO3 filler to prepared a stable suspension.

IT **67183-99-7 67184-01-4**
